EXPERIMENT 9

AI and Analytics Using Zia

AIM

To use Zoho Creator's Zia Build Agent and analytics components to summarize and visualize appointment information in the Patient Appointment Management System.

APPLICATION CONTEXT

The Healthify application stores appointment-related records. Analytics such as gender distribution, appointments by department, and totals by status can help users understand the records and support basic decision-making.

PROCEDURE

Step 1: Open the Healthify application in runtime view and review the Appointment booking Report.

Step 2: Open the Zia Build Agent panel and submit a natural-language request such as: “Show total appointments by status and create an appointment analytics dashboard with charts by department and gender.”

Step 3: Review the response and proposed changes. Apply them only if the proposed elements match the required application.

Step 4: Open the Patient Dashboard and inspect the available charts, including Gender Distribution and Appointments by Department.

Step 5: Check that the displayed charts reflect the available appointment records. Add representative test records if the chart requires more data.

Step 6: Capture the Zia prompt and dashboard views as evidence.

SCREENSHOTS / EVIDENCE

The following screenshots are from the submitted Zoho Creator work and are included as practical evidence.

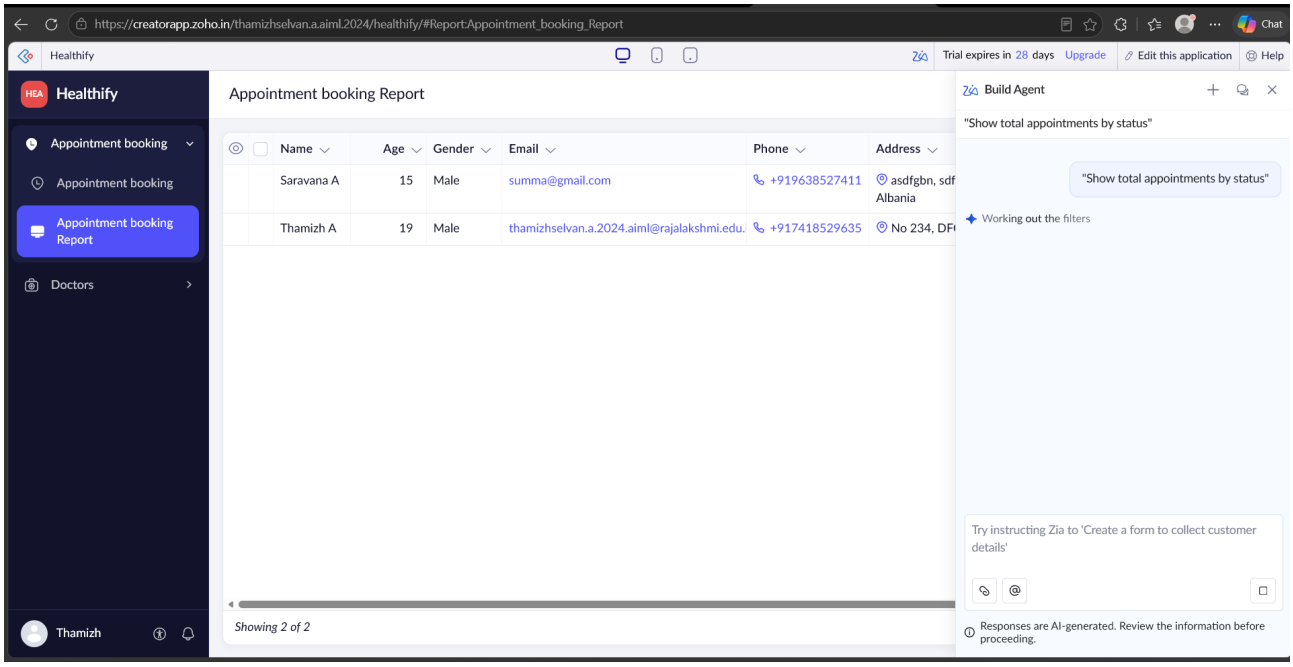

Figure 9.1: Zia Build Agent prompt for appointment-status analytics.

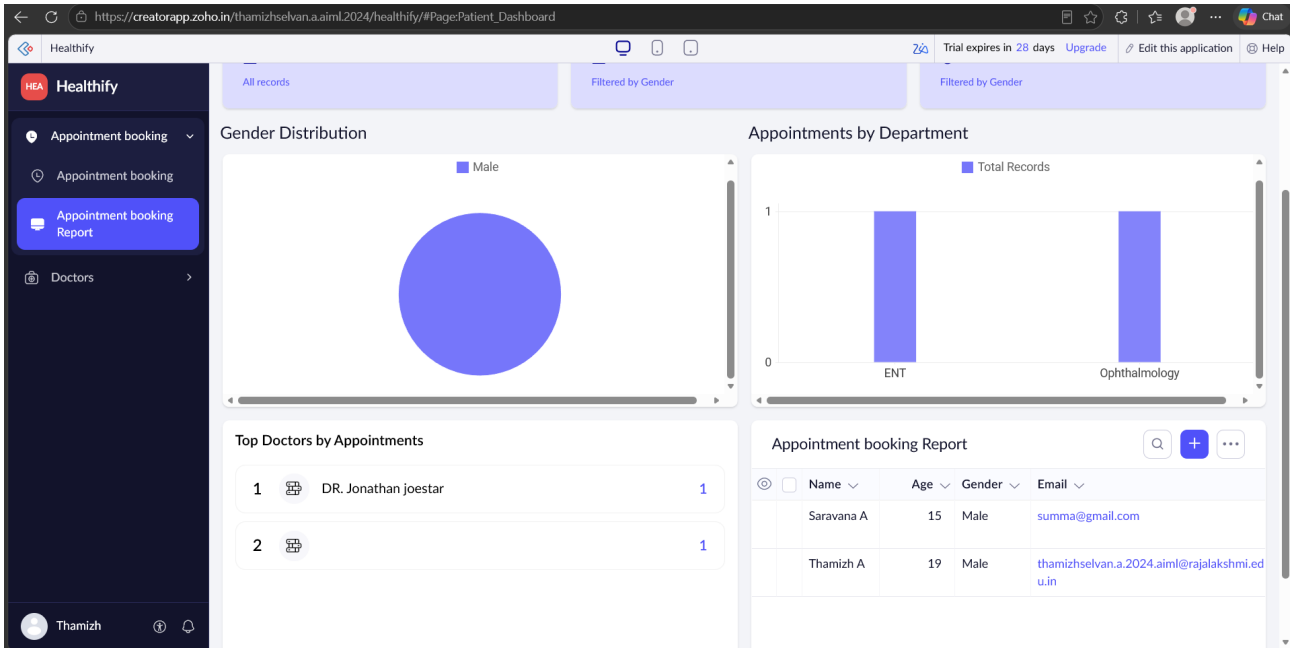

Figure 9.2: Patient Dashboard showing Gender Distribution and Appointments by Department.

RESULT

Thus, AI-assisted analytics was explored in the Healthify application. The submitted evidence shows a Zia analytics prompt and a dashboard containing appointment-related visualizations.
