EXPERIMENT 8

User Management and Role-Based Access Control

AIM

To configure user permission profiles and organizational roles in Zoho Creator for the Patient Appointment Management System, helping ensure that appointment information is accessed according to assigned responsibilities.

APPLICATION CONTEXT

The Healthify application contains appointment booking records and a report. Role-based access can separate the responsibilities of doctors, receptionists, and administrators. The submitted evidence shows Doctor and Receptionist permission profiles and corresponding roles under the CEO hierarchy.

PROCEDURE

Step 1: Open the Healthify application in edit mode and select Settings.

Step 2: Open User Permissions and inspect the Permissions tab.

Step 3: Create or verify permission profiles for Doctor and Receptionist. Set only the access needed for each role, such as viewing appointment records or updating relevant details.

Step 4: Open the Roles tab and create or verify the Doctors and Receptionist roles under the application hierarchy.

Step 5: Review the role hierarchy and check the reporting relationship under CEO.

Step 6: If the account allows user invitations, add a test user and assign the appropriate permission profile and role. If user invitations are unavailable, retain the configured profiles and roles as the demonstrated RBAC setup.

SCREENSHOTS / EVIDENCE

The following screenshots are from the submitted Zoho Creator work and are included as practical evidence.

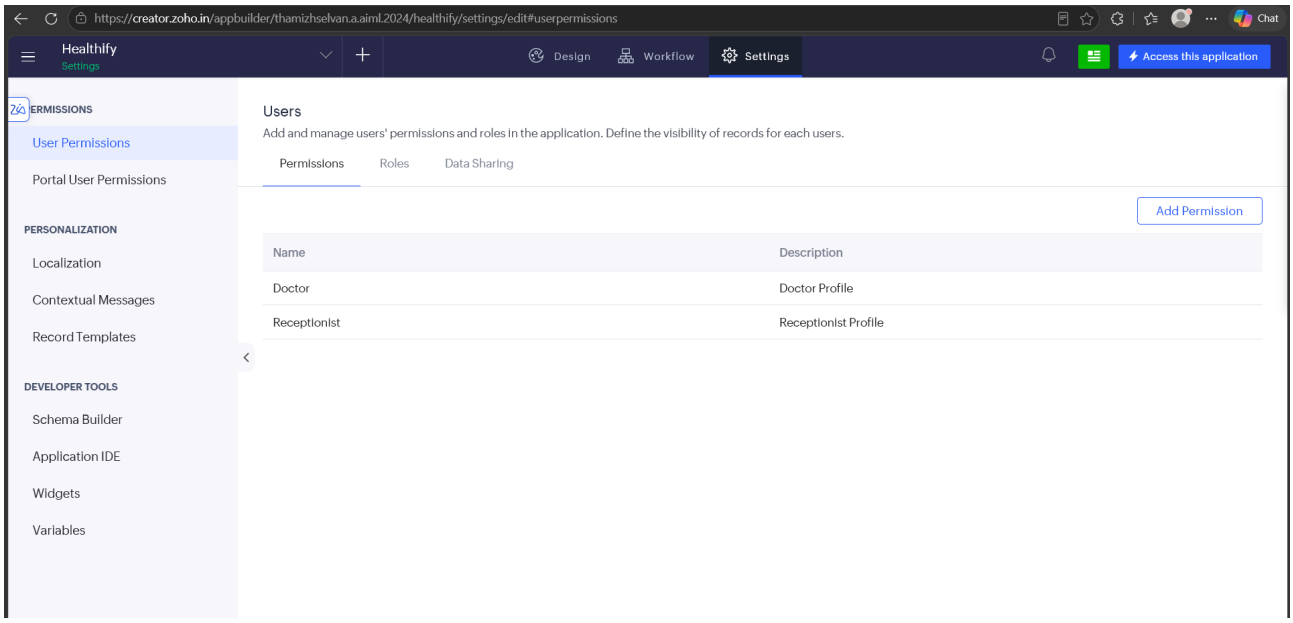

Figure 8.1: Permission profiles for Doctor and Receptionist in Healthify.

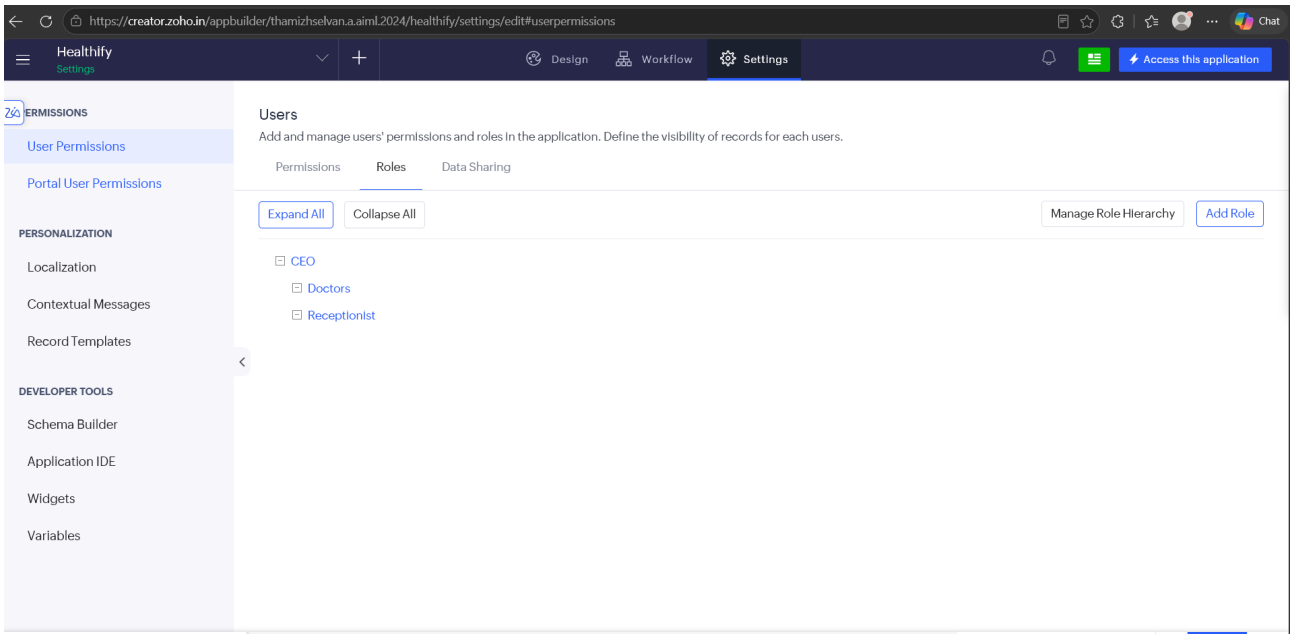

Figure 8.2: Role hierarchy showing CEO, Doctors, and Receptionist.

RESULT

Thus, permission profiles for Doctor and Receptionist and the corresponding role hierarchy were configured/verified in Zoho Creator for the Patient Appointment Management System. User-specific assignment can be completed where account permissions allow.
