EXPERIMENT 14

Pro-Code Extension Using Zoho Catalyst

AIM

To explore how a Zoho Catalyst serverless function can extend the Patient Appointment Management System with a separate backend service for appointment-fee calculation.

APPLICATION CONTEXT

The Healthify application is built in Zoho Creator. A Catalyst function named CalculateAppointmentFee is visible in the submitted console screenshot. A separate serverless function can be used for logic that is better handled outside the low-code workflow.

PROCEDURE

Step 1: Open the Zoho Catalyst website and access the Catalyst console.

Step 2: Open the project workspace used for the appointment-system extension.

Step 3: Under Serverless, select Functions and open the function named CalculateAppointmentFee.

Step 4: Review the function overview, runtime, function ID, and invocation URL displayed by the console.

Step 5: Open the Code tab to inspect the function implementation and confirm how it accepts input and returns a response.

Step 6: To integrate it with Zoho Creator, configure a suitable Deluge invokeurl action using the actual invocation URL and a JSON payload matching the function's expected fields.

Step 7: Test the endpoint and verify the response before claiming that the Creator-to-Catalyst integration is complete.

SCREENSHOTS / EVIDENCE

The following screenshots are from the submitted Zoho Creator work and are included as practical evidence.

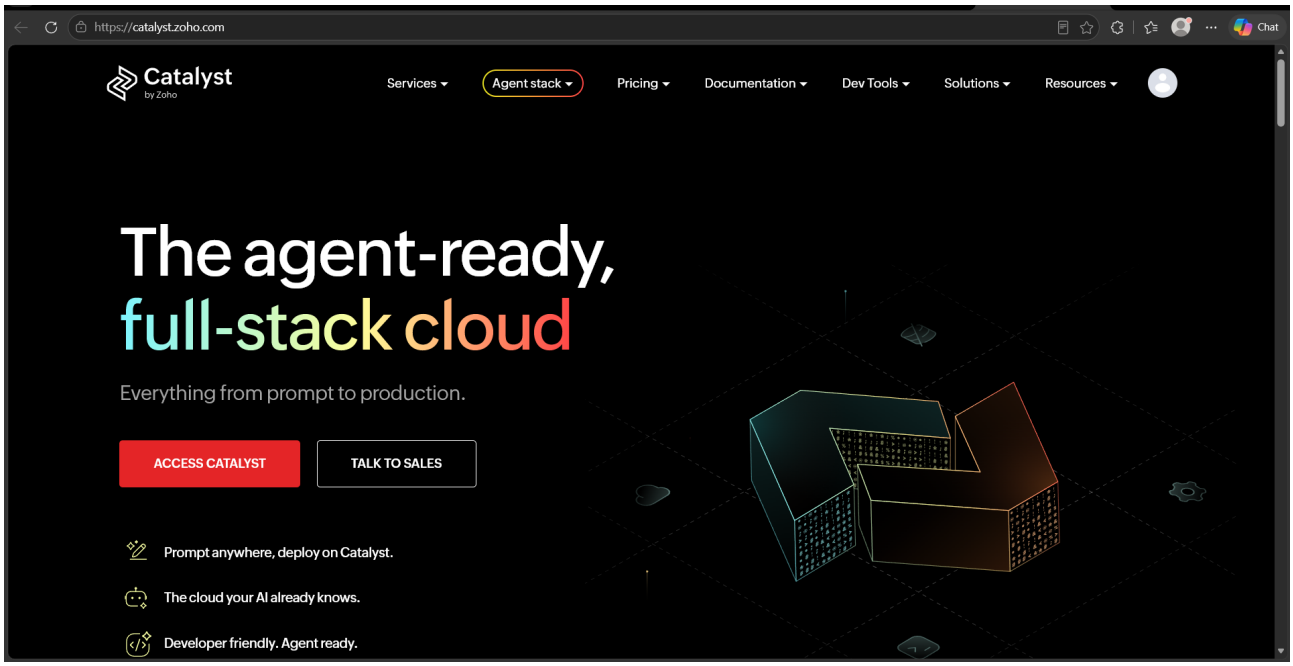

Figure 14.1: Zoho Catalyst platform homepage.

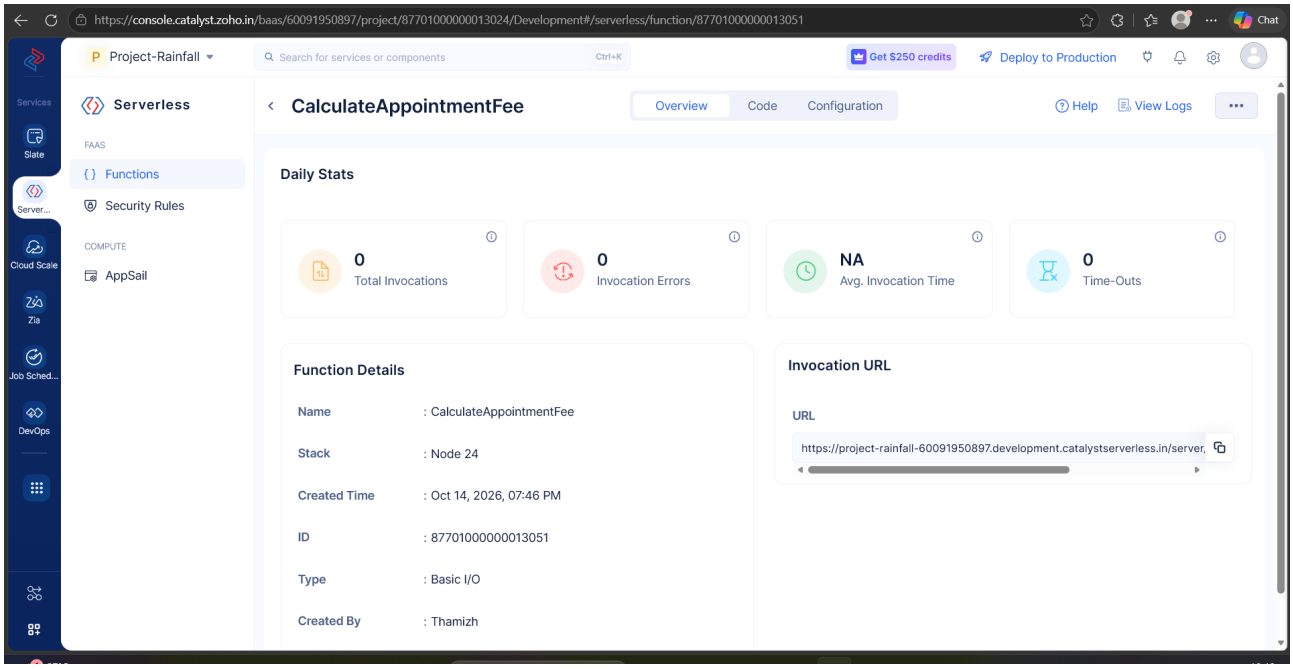

Figure 14.2: Catalyst serverless function overview for CalculateAppointmentFee, including runtime and invocation URL.

RESULT

Thus, Zoho Catalyst was accessed and the CalculateAppointmentFee serverless function was inspected as a pro-code extension for the Patient Appointment Management System. End-to-end integration should be reported as complete only after a successful invocation from Zoho Creator is verified.
