EXPERIMENT 10

Performance Optimization in Zoho Creator

AIM

To improve workflow efficiency in Zoho Creator by using criteria-based record lookups and conditional execution in the Patient Appointment Management System.

APPLICATION CONTEXT

Repeatedly retrieving all records or running every action without a condition can add unnecessary processing. The appointment workflow uses a direct Email-based lookup and a condition to check whether a matching patient record exists.

PROCEDURE

Step 1: Open the Healthify application in edit mode and select Workflow.

Step 2: Open the appointment-related workflow named Send_Appointment_Confirmation_Email.

Step 3: Inspect the workflow actions and identify actions that should run only when a condition is met.

Step 4: Review the Deluge script shown in the submitted screenshot. It queries Appointment_booking using the condition Email == input.Email and checks whether the returned record count is greater than zero.

Step 5: Keep the lookup criteria specific to the submitted email rather than fetching every appointment record.

Step 6: Save the workflow after checking that the condition and field names match the form. Test with a known email and verify the expected info message.

SCREENSHOTS / EVIDENCE

The following screenshots are from the submitted Zoho Creator work and are included as practical evidence.

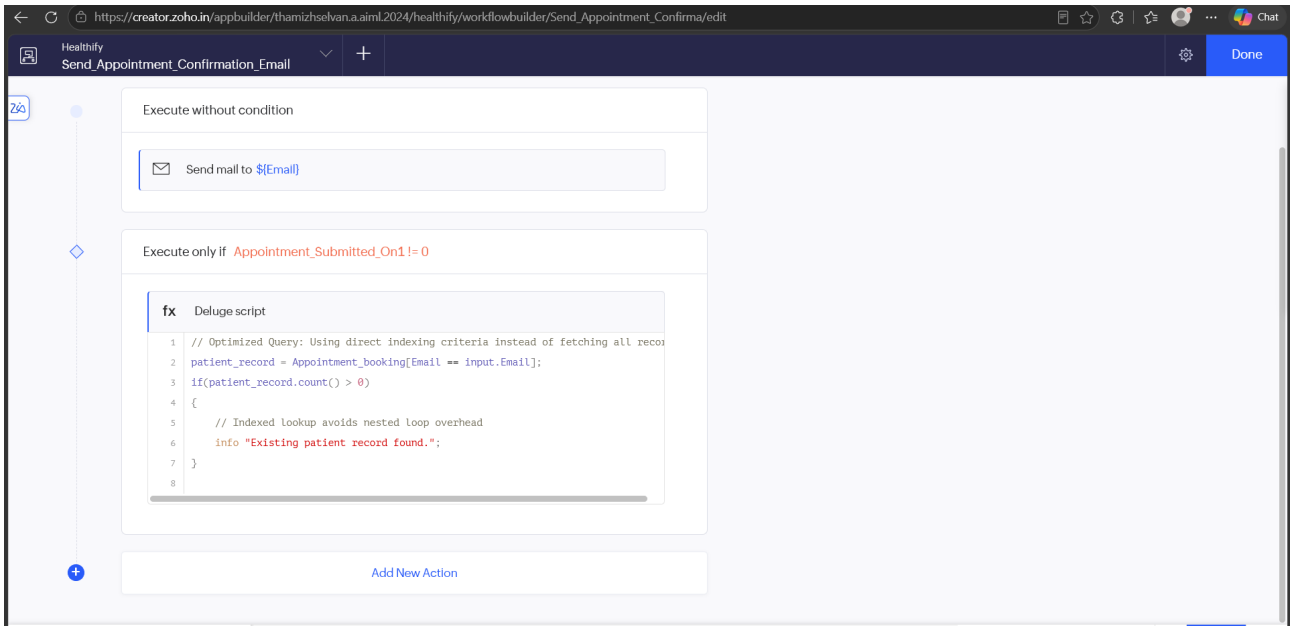

Figure 10.1: Appointment workflow with a criteria-based Email lookup and conditional execution.

RESULT

Thus, a criteria-based lookup and conditional workflow logic were reviewed for the Patient Appointment Management System. These measures reduce unnecessary record processing compared with broad, unfiltered lookups.
